Tracker

GET INTELLIGENCE ON THE ADDRESSES THAT ARE MOST IMPORTANT TO YOU

Identifying lucrative investment opportunities in the rapidly evolving cryptocurrency market can be challenging due to the lack of consolidated, real-time data on asset holdings and investment activities of leading crypto companies.

An insight platform tailored for Fidelity International that aggregates and analyzes data from top cryptocurrency exchanges and companies. This tracker-type application will provide Fidelity with a strategic overview of the market, enabling smarter investment decisions based on current trends and asset allocations.

Major Features

1. **Asset Holdings Dashboard**: The application will feature a dashboard showcasing major cryptocurrency exchanges and companies' largest asset holdings. This will offer Fidelity insights into preferred assets by market leaders, aiding in spotting trends and making informed investment choices aligned with current market trends.

2. **Manual Wallet Address Input for Custom Insights**: The application will include a feature for Fidelity to input public wallet addresses manually. This will allow Fidelity to analyze specific entities' investments and assets, helping them identify unique opportunities and refine their investment strategies.

The entire project will be developed using JavaScript, with Node.js powering the backend. To retrieve wallet addresses, the Alchemy API will be utilized, and the Moralis API will be employed to fetch real-time token prices.

Approach

1. The application will enable users to obtain detailed information on the assets and holdings within any given wallet address.

2. The platform will collect and display market movements of whale addresses, specifically those investing more than a million, to provide insights into their current market activities.
